Creating the Repository

- To create a web page with github, first we create a new repository:

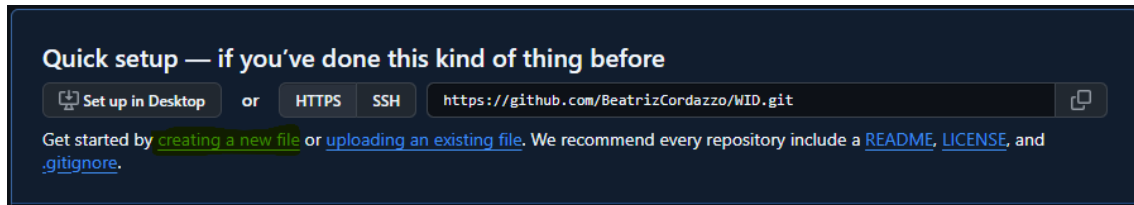

- First we name the repository, for example: WID (*Web Interface Design*), we keep it public, and select the “Create Repository” button:

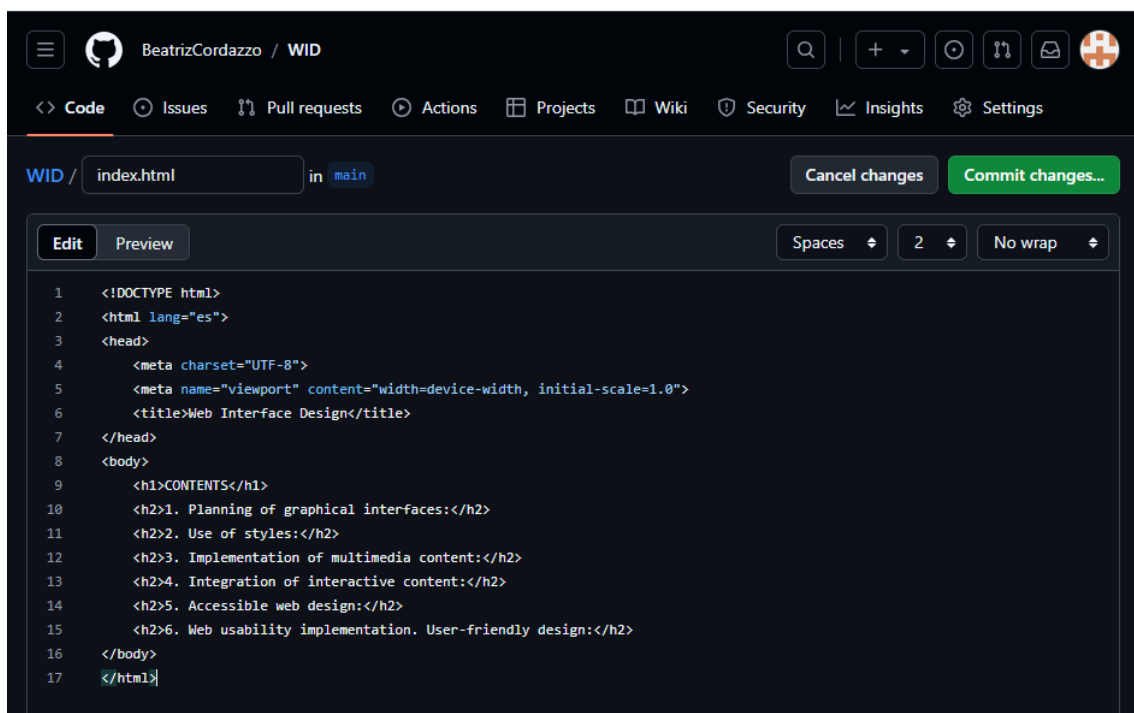

Creating the index.html

- Inside of the repository we need to create an **index.html**, so we select “creating a new file”:

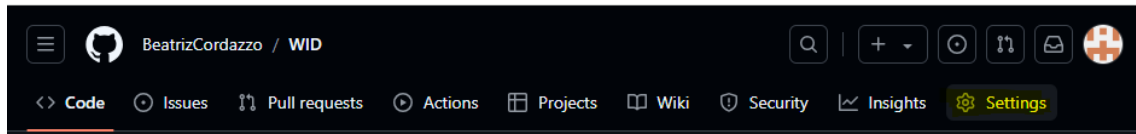

- We name the file index.html, and write the content we want, and then click the “Commit changes” button:

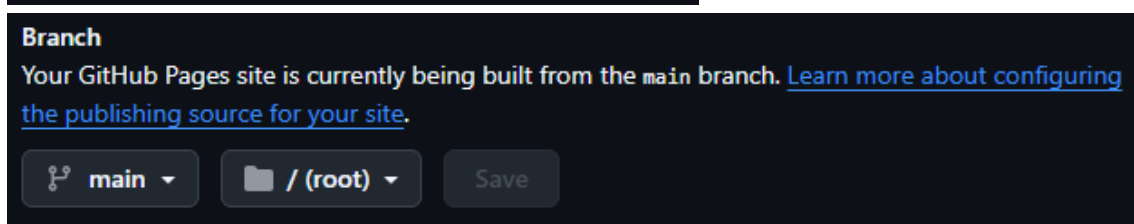

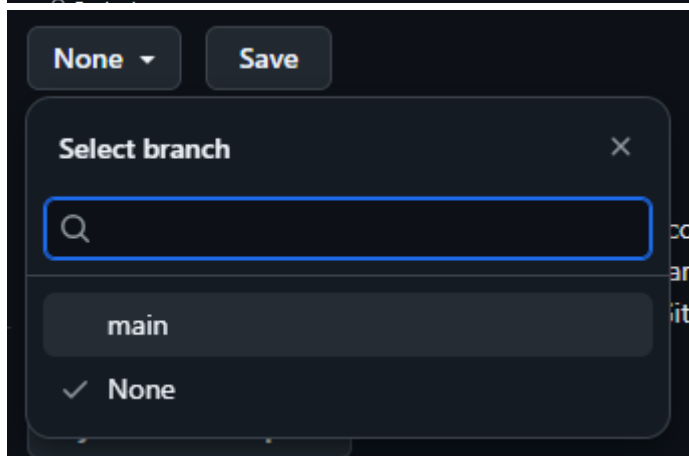

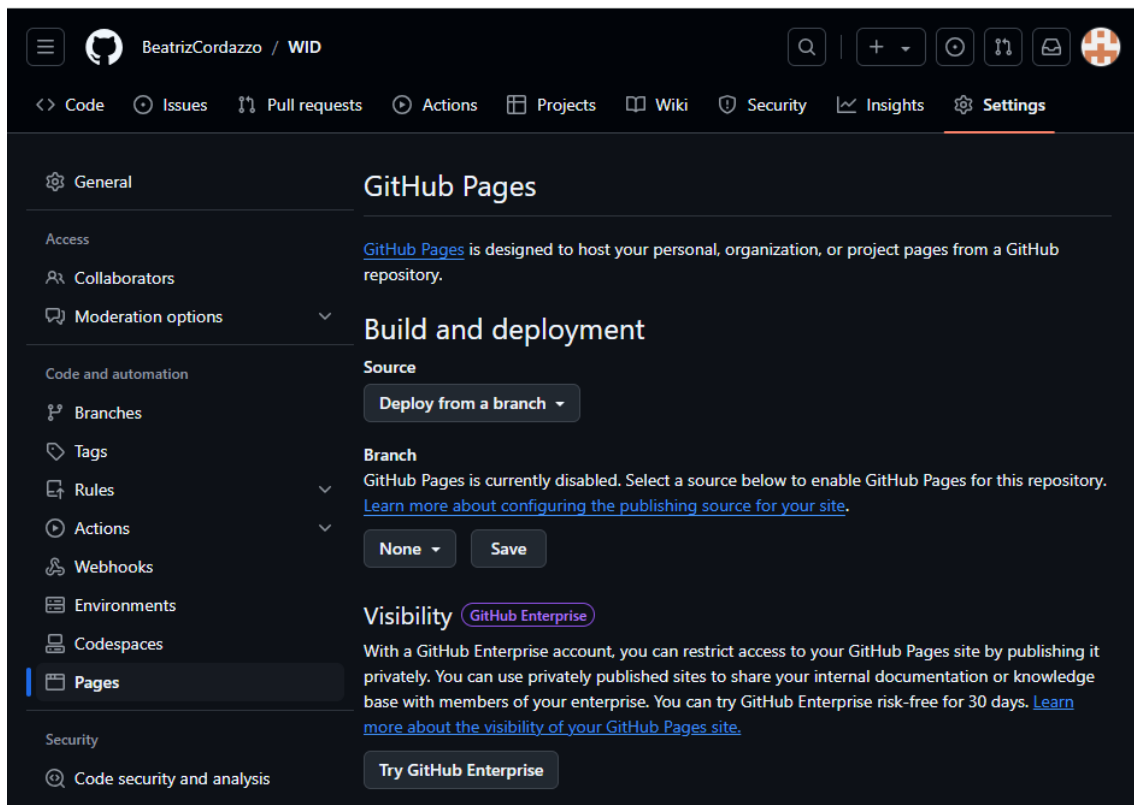

Settings

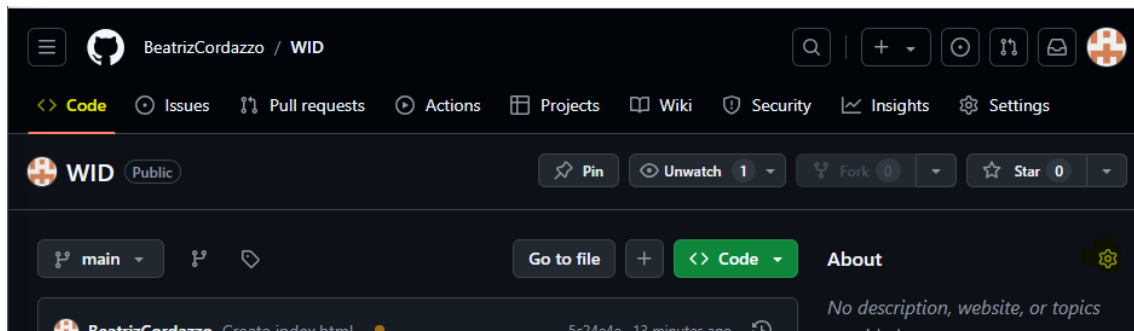

- To make sure our repository is linked to our web page, we first go to settings:

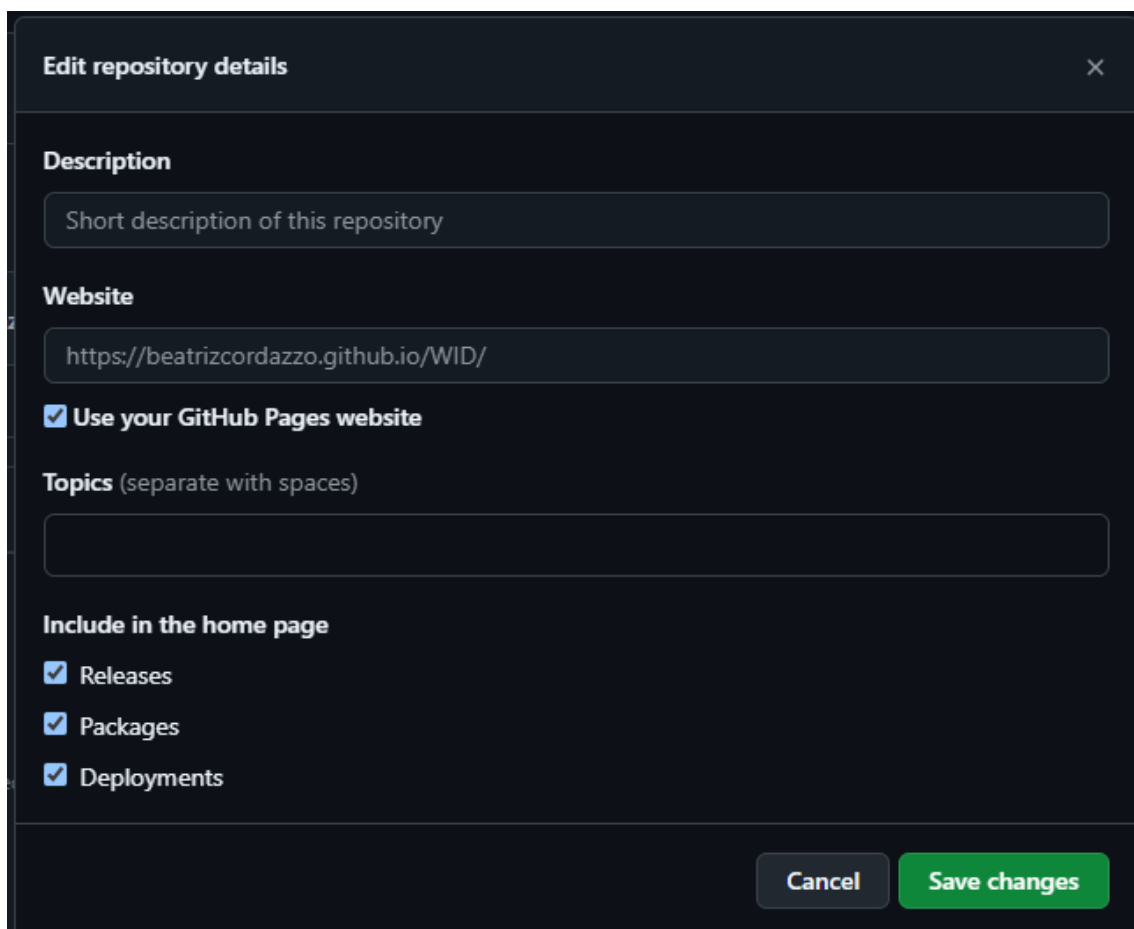

- On settings we select “Pages”. At “Branch” where it says **None**, we select the main branch, and save:

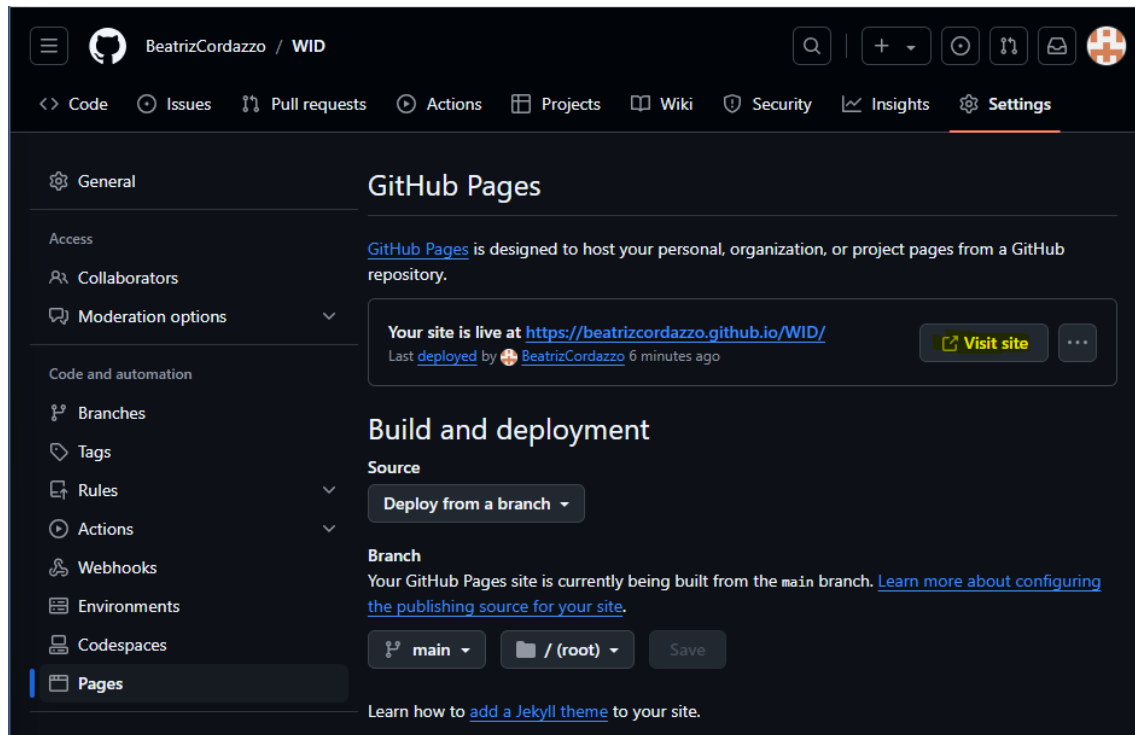

- We go back to “Code” and select the configuration that we can see right next to “About”:

- There, we're going to check the "Use your GitHub Pages website" box, and save the changes:

- To see the webpage, we go to the settings -> pages, and click on the “Visit site” button:

Final Look

- Here we can see the page:
